SUNSHINE GUIDE TO LAGO ARGENTINO AND THE PATAGONIAN LAKE DISTRICT, ARGENTINA

LOCATION: Lake Argentino is located in the Patagonian province of Santa Cruz, near the southern tip of Argentina. The eastern bulk of the lake is in Argentina, but it also extends across the Chilean border. The lake is glacier-fed, and lies at an elevation of some 700 feet above sea level. The major town is El Calafate, which also goes by the name of Lago Argentino. Nearby is the Argentinian Glacier National Park, featuring the magnificent Moreno Glacier.

COMMENTS: The lake has a four-season year. Spring runs from the middle of September through the middle of November. It offers alternating spells of cold wintry weather and mild summery weather. Summer extends from mid-November through mid-March. It is the driest time of year. Autumn takes in the period of mid-March through the middle of May. It offers the same changeable weather as spring, but with the rainiest weather of the year. Winter holds sway from the middle of May through the middle of September. It's cold, but fairly dry. Snow is common all winter, but the light totals and frequent thaws keep it from staying on the ground for long. In the mountains, elevation and the direction that the slope is facing are the two major controls of climate. As you go up in elevation, temperatures will drop an average of 1°F for each one-hundred feet of increase in elevation (and vice versa, when you go down).
